V
THE NEW GENERATION

MEASURING TECHNOLOGY

The absolute, linear position sensors provided by Tempsonics rely on the company's proprietary magnetostrictive technology, which can determine position with a high level of precision and robustness. Each Tempsonics® position sensor consists of a ferromagnetic waveguide, a position magnet, a strain pulse converter and supporting electronics. The magnet, connected to the object in motion in the application, generates a magnetic field at its location on the waveguide. A short current pulse is applied to the waveguide. This creates a momentary radial magnetic field and torsional strain on the waveguide. The momentary interaction of the magnetic fields releases a torsional strain pulse that propagates the length of the waveguide. When the ultrasonic wave reaches the beginning of the waveguide it is converted into an electrical signal. Since the speed of the ultrasonic wave in the waveguide is precisely known, the time required to receive the return signal can be converted into a linear position measurement with both high accuracy and repeatability.

R-SERIES V RF5 EtherCAT®

The Tempsonics® R-Series V brings very powerful sensor performance to meet the many demands of your application. The RF5 sensor is the R-Series V with improved flexible sensor rod. The main advantages of the flexible sensor rod are:

Straight and curved line

The flexible sensor rod enables position measurement on straight and also curved line.

Compact for transport and storage

For transport and storage, the RF5 sensor can be coiled up. This saves costs and space.

Installation with little space

Due to the bendable rod, the RF5 sensor can be installed even if only little space is available.

Large stroke length range

The sensor is available with stroke lengths from 150 mm to 20,000 mm and thus can be used in both short and long distance applications.

Fig. 1: Time-of-flight based magnetostrictive position sensing principle

In addition the R-Series V EtherCAT® scores with the following features:

30 positions simultaneously

The R-Series V EtherCAT® can detect and report the position, velocity and acceleration of up to 30 magnets simultaneously.

R-Series V EtherCAT®

In addition to the measured position value via the EtherCAT® protocol further data about the current sensor status, such as the total distance travelled, the internal temperature and the total operating hours, can be displayed for diagnostic purposes.

All settings under control with the smart assistants for the R-Series V

The TempoLink® and the TempoGate® smart assistants support you in setup and diagnostics of the R-Series V. For more information of these assistants please see the data sheets:

ADVANTAGES OF THE R-SERIES V RF5 COMPARED TO THE R-SERIES V RFV

R-Series V RFV
(previous design)

R-Series V RF5
(improved design)

The first magnetostrictive sensor with a flexible sensor rod was developed and introduced to the market by Temposonics over 25 years ago. With this experience, we have further developed the sensor to improve handling in your application. The R-Series V RF5 offers you the following advantages:

Shortened non-flexible area

- Compared to the previous design, the non-flexible area of the RF5 has been reduced by more than 70 % from 107 mm to 30 mm.

➤ *This makes it easier to install the sensor, especially in confined spaces.*

Smooth transition

- The transition between the non-flexible and flexible areas is designed to be smooth.

➤ *This makes it easier to install the sensor in your application.*

Reduced outer diameter and bending radius

- The outer diameter of the flexible sensor rod has been reduced to 6.4 mm
- This now allows a minimum bending radius of the flexible sensor rod of 100 mm.

➤ *This makes it easier to install the sensor, especially in confined spaces.*

Increased ingress protection

- The RF5-B base unit meets the ingress protection IP68 (3 d/3 m) (connectors and flange correctly fitted).
- Therefore, the internal waveguide is protected against the ingress of water.

➤ *This improves the longevity of the sensor in your application.*

NOTICE

- Specify number of magnets for your application and order the magnets separately.
- The number of magnets is limited by the stroke length. The minimum allowed distance between magnets (i.e. front face of one to the front face of the next one) is 75 mm (3 in.).
- Use magnets of the same type for multi-position measurement.
- The sensor is without rod assembly. Always insert the flexible sensor rod in a support pipe (e.g. sensor rod HD/HL/HP or HFP profile).

DELIVERY

- RF5-B:** Accessories have to be ordered separately.
- Base unit (without flange & rod assembly)
 - 3 × socket screws M4×59

GLOSSARY

D
Distributed Clock EtherCAT® uses a logical network of Distributed Clocks (DC) to synchronize the time on all local bus devices on the network. The EtherCAT® master usually selects the first Distributed Clock capable slave device as a Reference Clock, and then maintains a precise mapping of frame delays for all other slave devices in order to adjust their time to match the system time.
E
ESI The properties and functions of an EtherCAT® device are described in an ESI file (EtherCAT® Slave Information). The XML-based ESI file contains all relevant data that are important for the implementation of the device in the controller as well as for data exchange during operation. The ESI file of the R-Series V EtherCAT® is available on the homepage www.temposonics.com .
EtherCAT® EtherCAT® (Ethernet for Control Automation Technology) is an Industrial Ethernet interface and is managed by the EtherCAT® Technology Group (ETG). The R-Series V EtherCAT® and its corresponding ESI file are certified by the ETG.
Extrapolation The native measurement cycle time of a sensor increases with the stroke length. With extrapolation, the sensor is able to report data faster than the native cycle time, independent of the stroke length of the sensor. Without extrapolation, if data is requested faster than the native cycle time, the last measured value is repeated.
M
Multi-position measurement During the measurement cycle, the positions of every magnet on the sensor are simultaneously reported. The velocity and acceleration are continuously calculated based on these changing position values as the magnets are moved.
